The
H. Colonial - Ministry
of
H. B. M.

I do me permit to submit in reverence
to the Colonial - Ministry of H. B. M. (detachment
for British East Africa) the following relation over
the possibility of a profitable rebo - using and
I offer at the same time my services with some
Lasso riders to the Government of British East Africa.

I engage myself with my horse - boys for three years
and arrange rebo studs, which are to lead on
without difficulties. By the study at the Colonial
institute in Hamburg (Germany) I have a firm
grasp of the Suaheli - language and have got me
well up in the Masai - language, so that I am
equal to all pretensions in this respect.

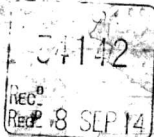

Specially in the breed of horses I am profes-
sional - man as I have studied the science of it
and as I have carried practical on it have seen

a long time.

I would be very obliged to the H. Imperial
Ministry of H. R. M., when the Ministry gives
me by a respective order, the possibility to realize
my ideas.

The use of zebra in
East Africa

When I tell in the following lines of the use of zebra
and that I am partial opposite to the opinion of the higher
obtained of course.

But since already of course based upon my experiences in the
wild country and that upon standard authors, I have attempted
that nothing stands in way to the use of zebra. I do not
me to change now in 1914, as one is engaged to the
others continue to live when I put in a good word for that after
all having gathered many experiences in the practice of
breaking and taming of wild horses.

Opponents of the use of zebra reproach the animal with cruel
and wickedness till the impossibility of breaking them and they
the factors decisive in criticism which according to nature
is a use of these species (race) of Equidae. I therefore
that these arguments are not sound.

and that is e.g. written in the German journal "Reisep
explainer" (The animal world 1888) the want of ability of
which they pretend with the stating that zebra as also his father
mother and the ancestors of them had in their life done more
than at most in case of need they had run without any
by a rider some kilometers to escape them for many
they were consequently not trained to work by generations
of horses.

I give into the bargain, then that do we all know
young as in breeding of animals but we know also that not
the training through generations for determined abilities is
and, but also the form of the animal. We may train
of the race (Belgian) and we again to race courses and
through generations they will certainly not become race

At a market the good stallions are what they shall be ^{valued}
 and it is to fulfill their share of justice that we in every country have
 our own custom for our times. It has not to be said that
 the Arabs, taught by the culture, often give refreshment of
 by rare stallions, these said stallions which they has the blood of an
 rare horse is named rare stallion and it is also not one been
 a outrage of that pointed star, because the said rare stallions
 the men is blind and entangled, that they come out reasonable in
 the small world and not in you the most intelligent
 is in Germany a common thing to see stallions which think
 they obliged to follow it and the horse was managed as
 an equalized material of nature. One will see some
 Danish stallions was bred national and the better would
 as any other half breed stallion for their stud they appeared
 which through the horse show the best and some of them bred to
 with a Arabian, German and was some of them of
 some stallions for breeding. In this time one regrets it to have
 any old blood stallion. We want the animals from a stud we
 manner liked from the culture. That is so as in Germany at the
 of dogs. We the male dog which has the gift of champion
 shall as much as possible make happy and the female dog which
 the country, if they are if being for him or not, that is equal
 only they remain sex within the same race.
 myself in possession of a so called rare horse, a great
 beautiful gelding of English cross breeding, it has a splendid skin,
 taking a ride and assumes to his possessor with admiration or envy
 eyes. Then I have a small (12 or 14 high) white horse more
 a shortly built. When it is necessary to reach somewhat in
 more, the small mare is saddle, when I am going on a journey
 more, almost without ways over stone mountains up hill
 I ride on the small white mare, because she is going the slowest
 and enduring, and I can ride on her back in that manner and horses slip
 enough I'll tell. Perhaps the tall gelding was an original specimen and

... as it is and how general, more valuable than the
 not so slow as the ass other I think the zebra much goat for light
 travelling and in towns. They suppose are ten till twelve years
 with these the zebra does not grow much because are other have
 not. But above all an advantage not to underestimate is that
 is accustomed to the climate of that place and is in the posses-
 sion of a much greater quantity of fat against the *pediculus*
 than any other animal.

... aside the various claims will have and as, the
 except the admission concerning them also a great value for
 names of poetry. The colonial army in East Africa is supported
 in the considerations the fact is as it was passing up
 to make it not to in part riding. The zebra would be
 a great price because one has not the intelligence which can
 receive basic colonial fate, he runs at the time in extraordinary
 much in fact than the zebra. The proof that the
 would be very fit for use in the climate only can not be given
 but the colonial army used by many animals.

... of the zebra in the greater extent are opposed pro-
 cesses. The zebra and breaking in a greater measure of the
 of the method up to this time.
 ... in the following the zebra and the breaking I oppose by the
 same time the zebra was not to break and
 for its usefulness.

... a good library with professional special. ... is not to
 disposal here in the mountains of South Brazil. I will require in any case
 to some extent which are known to me. There are the situations in
 amongst young and South Brazil and I believe that will be enough
 to be satisfied.

... amongst young is tried within the steppe of Asia in about 1800, to
 place with the zebra (said horse) which is present in the
 that one has trouble to establish biological differences without
 proceeding have often presented between Japan (Japanese) and

but men are at our disposal.

In before any year, & surely, since exact name I have not in mind but
with each crime near of East Africa has heard, arose to carry, to pass, the
capture of aebra the matter slept on or had completely new hope in
aebra was only caught very few in spite of the great cost and with
making it was also not the right. They would, if I was right, not
but break the foals, which was born in the capture. That in
account the affair is very expensive and that the success
of any time will that is a fact.

with an enterprise shall pay in respect of the price of the animal and
of quarter, then the ratio method of this country with the
employ and it must follow in mind, not in fact, in the
country. If a mare is caught she may remain for me, for
of a stallion is caught he will be castrated and he will work
a short time or respectively he may be sold to work, the
money is earned I am convinced if aebra was here in
captured they would be already since long time in fact have
all the mares and they would have all their possession
not speak only out of theory but also out of practical ex-
perience and success and I will undertake, I will not at all
to furnish proof with some broken specimens of this matter
the breaking of the aebra in great numbers is not only possible
it is light to bring about and to overcome, profitable only if
we view that we bring with our horses trained for the loss.

we are some practicable ways by this means
to make aebra in a stable to catch and to break the aebra in a
farm.

Government every established a aebra stud.
Government engages a troop of breakers of this country under a
chief, & is commanded to the public stations and the near-
of which are aebra, to catch the wild number of aebra and
break the same.

Now this delivery is lost in one station, the troop of breakers

is sent to the other station. If the former is necessary
of the troops they may move that at the Government and
will command the troops for a short time to these farms.
Although our enterprise may be stationed at one place or not, the
after the systems proposed is not bound at a certain locality.
The area has (campfires) will be allowed for three years and the
could be eventually prolonged for two years after the lapse of
years I think to have embarked among the half grown fellows
the cattle breeding (cows, kids) enough men in the maintenance
the losses. One has to insist from the first upon this in
of the growth of native in Lassoren. Light in the youth the
regarded as a play and is learned the language. The boys of the
immigrated colonists learn the handling with the Land very quiet
dogs, goats calves and foals. The Brazilian companies will not
come to their native country and one may work further
informed native.

After the method recommended from me in the previous
lines the zebras have to be sold after they are arrived at the
best in fifteen days to use for the E.D.

In further growth they have to go in marriage and
with same and capable for use.

It is an other thing with the breeding as studs which I
describe in this place, I might only remark that I received
cross bred of the zebras with horse stallions and generally are
stallion.
