Sends further report on recent outbreak  
in Uganda Province

The Federation

Letter 8/4/14

The suggestion in the last para but one  
of the attached report is a good one.

Something similar to the "travelling tent  
hospitals" that have been used in Egypt in  
combating ophthalmia seems to be required  
in the E.A.P. With this system treatment  
is brought practically to the patients door  
(vide page 27 annual report for 1909 of Deptt  
Public Health Cairo) & also page 15 of report  
of same body for 1911).

Sir,

In continuation of my despatch No. 237  
of March 13th, I have the honour to transmit  
herewith for your information a copy of a  
Report by Dr. C. L. Chevallier, Medical Officer,  
on the recent outbreak of Cerebro-Spinal  
Meningitis in the Nandi District of the Nyanza  
Province.

I have the honour to be,

Sir,

Your most obedient servant,

H. G. Buijse

GOVERNOR.

THE RIGHT HONOURABLE

LEWIS HAROURT, P.C., M.P.,

SECRETARY OF STATE FOR THE COLONIES,

DOWNING STREET,

LONDON, S.W.

## INCLOSURE

In Despatch No. of 19

Native Civil Hospital,

Kisumu,

March 2nd 1914.

~~Cerebro-Spinal-Meningitis in Mandi~~

189

Only a very short report is necessary to describe the present condition of the disease in this district as I found it. Not that the epidemic is not severe and serious but that in the short time at my disposal, 10 days, it was impossible to make a thorough investigation.

The Mandi have no villages but live in isolated or at most 2, 3 or rarely 4 huts together. Often it may be half a mile or considerably more to the next hut or small collections of huts. This is mentioned because such a scattered population does not favour the rapid spread of an infectious disease. Yet the chiefs assure me that the disease appeared simultaneously throughout the different locations into which the whole district is divided. If this could only be proved it would be a point of great medical interest.

At Kayabat, the Government station I saw no cases but within a very few miles I saw the first case and after that it is probably safe to say that I was never four miles from a case of Cerebro-Spinal-Meningitis.

It is quite impossible to give the mortality or number of cases though the District Commissioner had taken much trouble to obtain information as reliable as possible.

By collecting the number of deaths from the chiefs of the locations he had reported to me 164 in the last 20 days.

On

-27-  
On my trip I saw 19 certain cases

190

5 doubtful or very slight

Total 24

14 of these were children (5 babies) 10 adults 15  
female and 9 male.

It may seem at first surprising that I should  
consider this a serious epidemic considering I saw  
so few cases, but any one who knows the country is  
aware that directly the main road is left travelling  
becomes difficult. To reach a hut which might appear  
but a stone's throw away often involves a crossing of a  
steep ravine and then the Medical Officer may find his  
patient suffering from a bilious headache. So much  
time is wasted.

Nothing fresh was noted in the symptoms. Keenig's  
sign was always present and strabismus invariably in  
children.

Having had little experience of the disease I  
had not heard of the following Premonitory symptom  
i.e. a sharp pain at the tip of one finger or in  
one spot on the leg or arm. This was told me on  
three or four occasions in districts far apart.

In Shirore and Ross' excellent treatise it is  
mentioned that children are not specially affected.  
Certainly in Nandi children have suffered much more  
than adults and from what was seen and by hearsay  
women rather more than men.

The Nandi realise that the disease is very serious  
also that if the patient lives for three days the chances  
of recovery are much increased. The chiefs declare  
that they did not know the disease before and some of  
them are inclined to think that it is really a cattle  
disease which has now infected them. They say that

it started about four and a half months ago.

To combat this disease it would be necessary for a European Medical Officer to spend three or four months in India, 2000 miles away from his home, treating each patient with quinine.

The District Commissioner assured me that the cases would not be shown to an Indian Doctor,

I have &c., &c.,

B4/-C.L.Chevallier.

Medical Officer.
