DEDICATION

This work has been dedicated to my husband Mark Mbwayo for his great financial and moral support. To our children Anthony, Christine and Elizabeth for their encouragement and understanding during the time I was doing the project. Thank you all.

ACKNOWLEDGEMENTS

First I want thank the almighty God for the blessings He showered on me during the whole period when I was undertaking the course. I lacked nothing.

I wish to also thank my University supervisors Prof D. M Ndetei and Dr. L. I. Khasakhala for their professional assistance and guidance.

I would like to extend my gratitude to Dr. M. Mathai and Dr. Kuria for the changes they suggested after having read the document.

I want to thank my parents Christine and Peter Kinyanjui for the great faith they had in me that I will complete the project. This gave me the strength and courage to go on

I want to thank Victoria Mutiso for all the assistance she accorded me all through the study. I wish to thank my other colleagues in the program and in a special way Susan Muruingi, Margaret Gwada and Esther Kariuki.

I want to thank my colleagues in Uthiru Girls High School. Many of them contributed to this work in one way or another. Special mention goes to the members of the Humanity Department especially Maria Wangari and Mrs. A. Gathii, the Guidance and Counselling Department members especially Mr Gathaiya and Mrs Mukiri. I wish to thank Mrs. Chukunzira for proof reading the document. Mrs. L. Ogega made it possible for me to attend to my data collection while Mrs. Masai and Mrs. Kihungi kept encouraging me and giving help whenever I approached them. In a special way I cannot forget the Deputy Principal Mrs. Njeru who was a great source of encouragement and help. I also

want to thank the former Deputy Principal Mrs. Gikonyo for all the help she accorded me. Thank you.

I want to acknowledge the contribution of Mr. C Njeru for having read the work and made positive contribution. I want to thank the Principals of the four schools for allowing me to collect data from their institutions. I also want to thank all the students who answered the questionnaires

I want to extend my gratitude to AMHF for the support accorded to me from there in form of space, files and any other kind of support.

I want to thank my house assistance Anne Njoki for doing most of the work without complaining and the many cups of tea she prepared for me while I worked on the project

I cannot forget Mr. Kihoro the data analyst for his dedication and being there whenever I needed him.

To all that I have not mentioned but contributed to the project in one way or another, thank you very much and God Bless you all.

ABSTRACT

Objective:

To determine the prevalence of bullying and its association with psychological disorders among students in public Districts Schools in Kikuyu Division of Kiambu District.

Design:

A cross sectional descriptive study.

Setting:

4 public District Secondary Schools in Kikuyu Division, Kiambu District were studied. They are as follows: 1boys, 1girls and 2 mixed schools.

Method:

Self administered Questionnaires were filled. These are;

- The social- demographic questionnaire
- The Olweus Bully questionnaire
 - The General Health Questionnaire

Data Analysis:

Descriptive and inferential analysis.

Data presentation methods;-tables, charts and graphs and narratives are used.

Conclusion:

There is bullying in public District Schools in Kikuyu Division of Kiambu District. Bullying also leads to psychological Distress in the schools studied.

Application of results:

Will be used in formulating appropriate policies to deal with bullying from the school level to the national level.

DEFINITION OF TERMS.

Bullying: An aggressive behaviour intended to cause harm, both physical and psychological to an individual. The behaviour is repeated over time and occurs in a relationship of power imbalance.

The bully: The individual or person who perpetrates the bullying acts/actions.

The victim: The individual/person who the target of bullying acts/actions.

Bully-Victim: The individual/person who is both a perpetrator of bullying and is also a target of the bullying acts/actions.

By stander: The person present and witnesses bullying.

CHAPTER ONE

1.0 Introduction

It is unlikely that any school can be completely free from any form of bullying behaviour. The prevalence of bullying is high and available information on bullying has ranged from a reported 10% of children who were said to be victims of severe acts of bullying to 75% of children who reported being bullied at least once during the academic year. Researchers have concluded from these statistics that at least 25% of all children will be affected by bullying at some point during their school years and many of them missing a significant number of school days each year owing to fear of being bullied (1).

Bullying is a behavior that develops in response to a number of factors in the environment in which it takes place. This may be at home, at school or within the peer group. Bullying may also be an imitation of aggression experienced at home. Many cases of childhood bullies are those that have experienced abuse by a parent or have witnessed parental abuse of a spouse or siblings. Some have also been bullied by their siblings. Living with family members who are overly punitive, verbally or physically abusive also contribute to teaching children that aggression and violence are effective and appropriate means to attain a goal. Such children learn to strike back as a way of handling problems, thus promoting the bullying phenomena. In addition to experiencing inadequate or inappropriate discipline, bullies are likely to lack parental involvement, supervision and nurturing during childhood (2). The frequency and severity of bullying is related to the amount of adult supervision that children receive. Additionally, children who observe parents and siblings exhibiting bullying behavior or who are themselves victims are likely to develop bullying behaviors. When children receive negative messages or physical punishments at home, they tend to develop negative self concepts and expectations and may therefore attack before they are attacked. Bullying others gives them a sense of power and importance (3).

Whereas bullying has been extensively studied and reported in other parts of the world, there are few systematic studies on bullying in Africa. These include, a study in Nigeria by Egbochuku E. O. (6); in South Africa by De Wet Corene (7), in Zimbabwe, Egbochuku (6) quoted Zindi's work on *Bullying in Boarding Schools in Zimbabwe* and in Kenya by Ndetei et al (8). All these studies found high prevalence of bullying in their respective countries. Increased effort in carrying out more research on bullying is therefore necessary to determine its extent and effects in our Kenyan schools.

1.1 Background

Bullying has been defined by Rigby (9) as "repeated oppression, psychological or physical of a less powerful person by a more powerful person or a group of persons". A more widely recognized definition of bullying is given by Olweus (10) as 'an aggressive behaviour that is intended to cause harm or distress; that occurs repeatedly over time and one that occurs in a relationship in which there is an imbalance of power or strength'. These definitions highlight the key point that bullying does not occur when there is a conflict between people of equal or similar power. Bullying has two key components namely; repeated harmful acts and an imbalance of power. It involves repeated physical, verbal or physiological attacks or intimidation directed at a victim who cannot properly defend himself or herself because of size or strength or because the victim is out numbered or less psychologically resilient (11). Bullying can also take the form of direct or indirect acts (10). Direct bullying involves physical contact, verbal taunts, or the use of obscene threatening gestures. Indirect bullying involves more passive or aggressive actions such as spreading rumours, intentionally excluding someone from a group, or getting other children to assault a victim.

Bullying has been noted to be a form of anti social behaviour that is pervasive in schools, neighbourhoods and homes (12). It has also been noted in the Diagnostic and Statistical manual of mental Disorders (DSM – IV – TR) that bullying is one criterion of conduct disorder which is a specific psychiatric diagnosis characterized by a repetitive and

persistent pattern of behaviour "in which either the basic rights of others or major age appropriate societal norms or rules are violated" (2).

1.2 Statement of the Problem:

Bullying in schools is a world wide problem that has negative consequences for the general school climate and for the rights of students to learn in a safe environment without fear. Bullying can also have negative life-long consequences for both students who bully and for their victims (13). Victimization is associated with adjustment problems such as depression, low self esteem, anxiety, suicidal ideation and lack of friends. Physical consequences involve physical harm and a lot of stigmatization.

1.3 Justification of the study:

From various researches carried out world wide, bullying is quite prevalent and has negative impact on the victim, the bully and the victim-bully. In Kenya, a study carried out by Ndetei et al (8) indicated a high prevalence of bullying in Kenyan urban schools. It is therefore important to find out whether the problem of bullying exists in rural public District schools. It is also important to find out whether the Kenyan students who are victims, bullies and victim-bully experience the same kind of psychological effects as other students in other parts of the world where research has been carried out.

1.4 Significance of the study:

- a) School Management of the schools involved in the study will be made aware of the absence or existence of bullying so as to take remedial actions if necessary.
- b) Findings on psychological effects of bullying will be beneficial to parents and teachers in identifying and managing children affected by bullying.

c) The study hopes to provide additional information to the current database on the bullying behaviours to the Ministry of Education. With this information the Ministry of Education will strive to wipe out the vice. The research findings will form a basis for generalization to others schools in Kenya.

CHAPTER TWO

2.0 LITERATURE REVIEW

Extensive world wide studies during the 1980's and 1990's generally found that between 8% and 38% of students were bullied with some regularity and that between 5% and 9% of students bully others with some regularity. Chronic victims of bullying were bullied once a week or more and this number generally range from 8% to 20% of the student population (11).

Australian studies suggest that bullying is relatively high. Based on a study of more than 38,000 Australian children, at least 50% of the children have been bullied at school and approximately one child in six is bullied at least weekly by another child or group of students (14).

Boulton and Underwood (15), in a study of schools in England found that 21% of the children reported being bullied and about 17% reported bullying others sometimes or more often. Whitney and Smith (16), in a study on the nature and extent of bullying in Junior, middle and secondary schools in Sheffield, found that rates of bullying were disturbingly high, varying with year, gender and school location. Brunstein et al (17), in a study carried out in six New York State High Schools found that, approximately 9% of the sample reported being victimized frequently and 13% reported bullying others frequently. Nels Ericson (18), in a survey carried out by the National Institute of Child Health & Human Development (NICHO) found that 17% of the respondents had been bullied "sometimes" or "weekly"; 19% had bullied others sometimes or weekly and 6% had both bullied others and been bullied.

Baldry and Farrington (19) carried out a research on types of bullying among Italian school children and found out that over half of all students had bullied others in the previous 3 months and nearly half had been bullied. The study involved 113 girls and 125

boys. Salmon and Smith (20), in a study carried out in the United Kingdom found that prevalence of bullying was high. Ten percent of the pupils reported that they had experienced bullying "sometimes or more often" during that term, with 4% reporting being bullied at least once a week. Fekkes et al (21), in a study to establish bullying in Dutch schools, found that bullying was prevalent in Dutch schools. More than 16% of the children aged between 9-11 years reported being bullied on a regular basis and 55% reported regular active bullying during the current term.

Gotin et al (22), in a study of Jerusalem schools found that 57% of boys and 27% of girls had been bullied, while the percentage of those who carried out the bullying was 50.3% boys and 39.5% girls.

According to Kim et al (23), in a study of Korean Schools, 40% of all students were involved in bullying, 14% were victim only, 17% perpetrator only, while 9% were victim-perpetrator

Forero et al (24), studied children from New South Wales, Australia, and found that almost a quarter of the students; 23.7% bullied other students. 12.7% were bullied and 21.5% were both bullied and bullied others on one or more occasions in the last term of school.

2.1 Gender Differences:

The degree of bullying varies within gender. Boys are reported to be the most likely than girls to bully other students (10,25,26,27). Girls report being bullied by both boys and girls, whereas boys typically are bullied only by other boys (10,27). There are some marked differences in the kinds of bullying that boys and girls experience. Boys are more likely than girls to report being physically bullied by their peers (27). Girls on the other hand are more likely than boys to report being the target of rumor-spreading and sexual comments (27). Girls are also more likely than boys to bully each other through social exclusion.

Boulton and Underwood (15) reported that both being a bully and being bullied were more prevalent among boys than among girls. They also found out that most boys were bullied by other boys only whereas girls were more likely to be bullied by children of either sex.

According to Baldry and Farrinton (19), boys bullied more than girls, and that both boys and girls tended to be bullied by boys. Kaltiala-Heino et al (28), in a study of Finnish adolescent students, a total of 9 % girls and 17% boys were involved in bullying on a weekly basis. Forero et al (24) found that more boys than girls reported bullying others and being victims of bullying. Fekkes et al (21) in a study of Dutch Schools did not find a significant difference in being bullied between boys and girls. In Nigeria Egbochuku (6) found that more boys than girls were found to be both victims and bullies.

2.2 Bullying in Urban, peri -urban & Rural Communities

Recent findings from a national representative study of 6th- 10th graders found out that youth from urban, sub urban town and rural areas in the United States were bullied with same frequency (27). Very small differences were found in students' report of bullying others. Youth in rural areas were 3% to 5% more likely than youth in towns, sub urban areas or urban areas to admit bullying their peers.

2.3 Location of Bullying:

Bullying is much more common at school than on the way to and from school, such as on the bus, at the bus stop or elsewhere in the community (10, 26, 27). Common locations for bullying at school include the playground (for elementary children), the classroom, both with and without the teacher present, the lunchroom, and the hallways (29).

2.4 CONSEQUENCES OF BULLYING:

Bullying can have long term effects on academic, physical and emotional consequences on bullies, their victims and bystanders. The incident of bullying at school has negative impact on students. Opportunities to learn in an environment that is safe and secure and where they are treated with respect are denied (4, 30).

Rigby (31) established that peer victimized girls reported a higher incidence of emotional distress and more perceived adverse health effects compared with 'others' and victims of both sexes indicated significantly worse mental and physical health. Among boys, only bullies consistently reported poorer health.

Effects of bullying have been classified into the following:

2.4.1 Low Psychological Well Being:

Being victimized at school has been related to self esteem. Using various reliable self esteem measures, these study results generally indicate low self esteem or low global self worth (a similar concept is associated with repeated victimization) (32). Olweus (10) reported that in Norway, boys between 13 and 16 years who were victims at school had lower than average self esteem, a condition that was found to persist into their twenties. In Ireland, (33), Australia, (34), and England, (35), have confirmed the connection between low self esteem and being repeatedly bullied at school. Boulton and Underwood (15) also found that victims of bullying but not bullies were most likely to report feeling unhappy and lonely at school and to report having fewer friends.

2.4.2 Poor Social Adjustment:

Bank (13) notes that as many as 7% of America's eight graders stay home at least once a month because of bullying. The act of bullying tends to increase some students' isolation because their peers do not want to loose status by associating with them or because they do not want to increase the risk of being bullied themselves. Studies conducted in Australia have observed that victimized students are likely to report more absenteeism from school than other children, and, moreover, absenteeism was shown to increase as a function of the severity of victimization, (32). Juvonen et al (36), found that bullies, the victims and the bully-victim compared to other students displayed school problems and difficulties getting along with others.

Salmivalli et al (37), notes that children exposed to systematic victimization by their peers suffer from adjustment problems.

Data from a retrospective study of U.S. adults suggested that the interpersonal difficulties of men subjected to victimization at school may take the form of disabling shyness and fear of intimacy that make relationships with the opposite sex difficult or impossible. This suggestion was subsequently confirmed in a further Australian's retrospective study of adult men and women. (38)

2.4.3 Psychological Distress:

Numerous correlation studies have reported that symptoms of chronic anxiety and fear are often associated with experiencing peer victimization. An early Swedish study of so called "whipping boys" (that is boys frequently targeted by aggressive peers) reported that such children were significantly more anxious and insecure than others (39). Further studies carried out in England (40) have reported that feelings of anxiety characterized peer victimized children.

Among English secondary school students, it was observed that victimized children tended to report feeling irritable, nervous and panic after episodes of bullying, 32%

indicated that they had recurring memories of bullying incidents and 29% had subsequently found it hard to concentrate (41). Juvonen et al (36) also found that victims were emotionally distressed and socially marginalized among their classmates. Bully-victims were the most troubled group, displaying the highest level of conduct, school and peer relationship problems.

A connection too, has been suggested with severe depressive tendencies and bullying. Among Canadians, those reporting high level of peer victimization were found to be more depressed than others (42). A study of Finnish school children aged 14 years to 16 years reported that 18% of student identified by peers as frequently victimized showed significantly more depression than did others (43). Kaltiala-Heino et al (44) found that there was increased prevalence of depression and severe suicidal ideation among both those who were bullied and those who were bullies. Depression was equally likely to occur among those who were bullied and those who were bullied and those who were bullies and those who were bullies by others and who were also bullies themselves.

Kaltiala-Heino(28) found that anxiety, depression and psychosomatic symptoms were most frequent among bully-victims. Among girls, eating disorders were associated with involvement in bullying in any role, but among boys with being bully-victims only. Lyndal B et al (45) established in a study, that victimization raised levels of subsequent self reported symptoms of anxiety or depression regardless of the coexisting levels of social adversity. In Australia, adolescent school children, both boys and girls who had been reportedly bullied (according to peer reports as well as self reports were found to be more prone to suicidal ideation than other students (14). In a study carried out in Korean schools, results indicated that school bullying, and being a victim- perpetrator in particular are significant risk factor for suicidal ideations in adolescents, independent of other suicide factors such as anxiety or depression, gender, social economic status, residence and family structure (23). Nansel, T.R et al (27) found that perpetrating and experiencing bullying were associated with poorer psychosocial adjustment. Salmon et al (46) findings in an adolescent unit, was that the students who attended the unit as out patients, being bullied was frequently a factor in the presentation of adolescent psychiatric services, with depression being the diagnosis in over 70 per cent of cases. In contrast, bullies and bully-victims were most likely to present conduct disorders which were frequently co-morbid with attention deficit hyper activity disorder. Van der wal et al (47) found that depression and suicidal ideation are common out comes of being bullied in both boys and girls. These associations are stronger for indirect than direct bullying. Boy and girl offenders of bullying far more often reported delinquent behaviour. Bullying others directly is a much greater risk factor for delinquent behaviour than bullying others indirectly. Boy and girl offenders of bullying also more often reported depressive symptoms and suicidal ideation.

2.4.4 Physical Ill- Health Symptoms:

Researchers have identified that victims of bullying were more likely to report experiencing poorer general health (10), and have more migraine headaches (48). Williams et al (49) found that there was an association between children reporting being bullied sometimes or more often and reporting not sleeping well, bed wetting, feeling sad and experiencing more than occasional headache and tummy ache.

A significant trend for increasing risk of symptoms with an increasing frequency of bullying was shown for all reported health symptoms.

2.5 Consequences on the Bully:

Teens (particularly boys) who bully are more likely to engage in other anti social delinquent behaviours, for example, vandalism, shoplifting truancy and drug abuse into adulthood. They are four times more likely than non bullies to be convicted of crime by age 24 with 60 % of bullies having at least one criminal conviction (10),

Ward CL et al (53) in Cape Town found that rates of exposure to violence and related symptoms were quite high in high schools; symptoms were associated with exposure to violence. In a study carried out in Nigeria, results indicated a prevalence rate of almost four in every five participants (78%) reporting to having been bullied to some degree and 85% of the children admitted to bullying others at least once (6). In a study carried out by Ndetei et al (8) in Kenya, the prevalence rates of bullying ranged between 63% and 85%.

There is evidence of wide spread bullying not only within particular schools but all over the world. Bullying affects both boys and girls though boys seem to have higher incidents of bullying compared to the girls. Bullying also has an effect not only on the victims but also on the bully and the witnesses or bystanders. The research will try to find out the occurrence and effects of bullying on rural public district secondary school students.

CHAPTER THREE

3.0 METHODOLOGY

3.1 Research Objectives:

Main objective:

To determine the prevalence and psychological disorders of school bullying among students in public District schools in Kikuyu Division:

Specific Objectives:

- 1) To determine the prevalence of bullying.
- 2) To determine the differences in bullying between boys and girls in these schools.
- 3) To identify the modes of bullying
- 4) To establish the association of bullying and psychological profiles.

3.2 Hypotheses:

Null hypotheses

- I. There is no bullying in District Public schools in Kikuyu Division.
- **II.** There is no association between bullying and psychological pathology.

Alternative hypotheses

- I. There is bullying in District Public schools in Kikuyu Division.
- II. There is an association between bullying and psychological pathology.

3.3 Study Design.

This was a cross-sectional descriptive study.

3.4 Study Population.

Kikuyu Division is in Kiambu District, Central Province, Kenya. It has different categories of secondary schools: 2 National Schools and 4 Provincial schools. The Division has a total of 15 District schools. Of the total number of schools, one is a boy's only, one a girl's only, while thirteen are co educational. One school has 80% of the total population as boarders while the remaining 20% are day scholars. The rest of the district schools are day schools.

District schools in Kikuyu Division, Kiambu District are public schools which mainly admit students from the neighbourhoods. The age range of the students is between 14.5 years to19.5 years. In the division, the District Schools target students who generally have not been selected to join provincial secondary schools. However, some students have merited joining the provincial secondary schools, but they find the school fees high, and thus opt to join the district secondary schools whose school fees is lower.

The researcher's choice of Kikuyu Division is based mainly on some key considerations. The only significant study on bullying was done in Nairobi; the cosmopolitan capital of Kenya (8). There is no information on rural schools, at least for purpose of comparing rural and urban settings. Kikuyu Division is convenient to the researcher since it is near Nairobi where she is under taking her studies. The researcher also teaches in a School in Kikuyu Division. Knowledge on the prevalence and pattern of bullying in the Division would be appropriate for the researcher to initiate advocacy in an environment in which she works and is familiar with.

3.5 Sampling Method:

Three schools were studied; two single sex and one mixed school. The two single sex schools were included purely on that basis. They helped the researcher understand whether in single sex schools bullying modes are different and whether the consequences are different from those of mixed schools. The third school was a mixed school. This school was picked randomly from the 13 remaining mixed schools.

The names of the 13 schools were written on different pieces of paper. These papers were then put in an opaque container which had a lid. Thorough mixing was done and then one paper was picked. The person picking was instructed not to look at what he or she was picking. To ensure no cheating he or she had their eyes covered. Total population of the three selected schools was 1330 students. All form 1 to 4 students were studied. This ensured that there was no biasness introduced through feelings of exclusion by students and no bully or victim was left out.

3.6 Inclusion criteria:

- a) Public District School students from Kikuyu Division.
- b) Schools whose principals have given consent.
- c) Student participants have given assent.

3.7 Exclusion criteria:

- a) Students outside Kikuyu Division.
- b) Students whose schools are not registered as District public Secondary Schools in Kikuyu Division.
- c) Schools whose principals decline to give consent.
- d) Participants who do not give assent to participate.

3.8 Instruments:

Three instruments were used:

I. The socio- demographic Questionnaire.

This was constructed by the researcher to capture the socio-demographic information of the student. The information captured included: the form of the respondent, category of the school, age, gender, the number of siblings, position of birth and finally whether the parent(s) are alive.

II. The Olweus Bullying Questionnaire.

The Olweus Bullying Questionnaire was developed by Dan Olweus, a Swedish psychologist (1991). It is a self administered questionnaire. All the questions refer to the student's own experience at any time in his or her present school over the previous six months. It has been used extensively in many countries for example in Norway, Australia, Turkey, and Kenya. . The questionnaire requires either a "Yes" or "No" answer to any question on whether bullying has occurred or not in the six months. Frequency over the last six months is measured as follows:-Seldom =1-3 times, frequent =4 times or more. It is composed of sections A and B. Section A asks questions related to direct bullying symptoms/signs such as being called bad names, belongings taken, told lies about you, nasty tricks played on you and if had been threatened/ blackmailed, beaten up or hit and whether the student had done the same to colleagues. It also enquires on the frequency, location, class and gender of the bully. Section B deals with the so called indirect bullying, like refusing to play with you, said would not be your friends anymore, telling nasty stories that are not true about you, and spoiling other students games (8).

III. General Health Questionnaire.

The General Health Questionnaire (GHQ) is a measure of current mental health and since its development by Goldberg in the 1970's; it has been extensively used in different settings and different cultures (54). The GHQ has been used extensively validated with adults. It has been used with adolescents (54). Research by Tait et al (55) found the instrument to be a valid index of psychological well being of the adolescent population. The scale asks whether the respondent has experienced a particular symptom or behavior recently. Each item is rated on a four point scale (less than usual, no more than usual, rather more than usual, or much more than usual). Scoring is the Likert scoring styles (0-1-2-3) from left to right. 12 items, 0 to 3 each item and the score range from 0 to 36. Score>15 shows evidence of distress. Score >20 suggests severe problems and psychological distress. The study will use the GHQ-12. It is brief, simple, easy to complete, and its application in research settings as a screening tool is well documented (54).

3.9 Ethical Considerations.

The process begun by obtaining approval from the Department of Psychiatry, University of Nairobi and then application of ethical clearance from Kenyatta National Hospital Research and Ethics Committee. The researcher then sought permission from the Ministry of Education, as all the public schools in Kenya are under this ministry, and finally from the heads of the concerned institutions. The logistics of bringing all the parents or guardians together for this study would be prohibitive both economically and time wise for otherwise parents or guardians who were busy earning a living for their families, whether it is a day or boarding school. The care and guardianship of a child while in school is vested on the head of the institution on behalf of the parent or guardian. The research did not involve any invasive procedures. The head of the concerned institution could give or refuse consent on behalf of the parent or guardian. Confidentiality was assured to the students in the introductory letter in every questionnaire. They were also informed that they did not have to participate in the research if they did not want to. At the same time they were informed that they could withdraw if they wanted to, with no penalties.

Benefits of the study include the fact that those students who have experienced bullying but had no chance of telling anybody could do it. Those with psychological distress due to bullying will get a chance of getting help if they need it. The researcher's contact was availed to the students and the principal. If bullying incidents are identified the school management can put anti-bullying programmes in place.

Procedure of Administration

The researcher explained to the principal about the research through the consent explanation form, and then where consent was granted she or he signed the consent form. The researcher explained to the students about the research and its benefits, assured them of confidentiality and freedom of participation without coercion. Those who accepted filled the anonymous questionnaires: - the socio-demographics, the bullying and the general health questionnaire. When the student completed, they folded and stapled them, then dropped them in a sealed ballot box. Afterwards the researcher collected the ballot boxes and transported them to the data entry point. This ensured that confidentiality at all levels was maintained.

3.10. Administration of the Questionnaires to the students

On the appointed day and time the students were explained to about the research, assured of confidentiality and any other concern they had was explained to them. With the help of the class prefects the questionnaire sets were given. The set consisted of

- a) Assent explanation.
- b) The socio demographic questionnaire,
- c) The Olwues Bully Questionnaire,

d) The General Health Questionnaire.

All the above questionnaires were self administered. After the students finished filling them, they then folded them and put them in a box which was placed at the front of the class. When the whole school completed, the boxes were transported back to the working centre of the researcher by the researcher.

3.11 Data Analysis

The questionnaires were entered and analyzed using SPSS version 12.0. The analyzed data is both descriptive and inferential statistics.

3.12. Presentation of the data

The analyzed data is presented using frequency tables, bar graphs and pie charts.

CHAPTER FOUR

4.0 RESULTS

4.1 SOCIO DEMOGRAPHIC CHARACTERISTICS

4.1.1 Age

The age of the students ranged between 14 to 22 years. They were grouped in the following: 14-15 years, 16 - 17 years 18 - 19 and 20 + years.

4.1.2 Gender

In terms of gender, the boys contributed 74.9% while the girls contributed 25.1%.

4.1.3 Level of Education

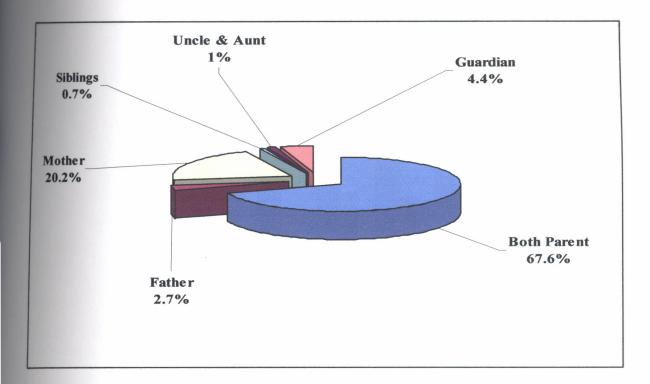

The total number of students studied was 1305 and the distribution of the students per form was as follows: Form One had a total of 200 students (15.3%), Form Two a total of 575 (44.1%) Form Three a total of 389 (29.8%) while Form Four had a total of 141 (10.8%).

4.1.4 Category of School

During the research four schools were studied and they are as follows: one boy's school contributing 51.1%, one girl's school contributing 9.5% of the total data and two mixed schools contributing 39.9% of the total data. Of the these schools, one was boarding contributing 51.1% while all the others were day schools contributing 48.9% of the total data.

4.1.5 Living Arrangements

Majority of the students under research were living with both parents 67.6% while the rest were living with: father 2.7%, mother 20.2%, siblings 0.7%, aunt and uncle 1.0% and guardians 4.4%. These are represented by figure 1.

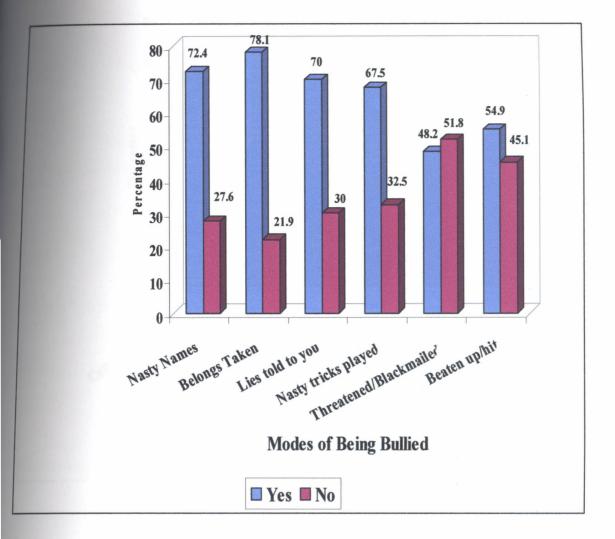

4.2 PREVALENCE OF BULLYING

Both direct and indirect bullying either as a victim or a perpetrator was studied. The results varied depending on the mode of bullying and whether it is direct or indirect bullying.

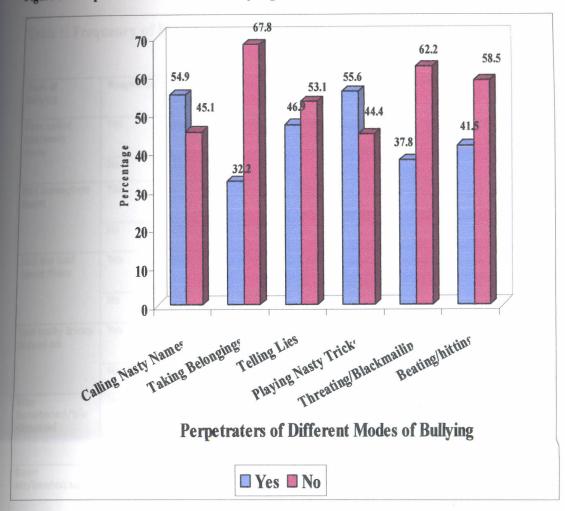

The prevalence of victims direct bullying was as follows: The different types of bullying and their prevalence were as follows: 72.4% of the students had been called a nasty name, 78.1% had their items taken, 70.0% had lies told about them, 67.5 had nasty tricks played on them, 48.19% had been threatened or blackmailed, 54.9% had been beaten up or hit. This is illustrated by figure 2 below.

Figure 2: Victims of Direct Bullying

The prevalence of perpetrating direct modes of bullying varied as follows: 54.9% said that they had called others nasty or bad names, 32.2% had taken belongings from others, 46.9% had told lies about other students, 55.6% had played nasty tricks on others, 37.8% had threatened or blackmailed other students, while 41.5% had hit or beaten another student. All these were carried out in the last six months. These are shown by figure 3 below.

Figure 3: Perpetrators of Direct Bullying

Apart from the prevalence, the questionnaire was able to pick the frequencies of the different modes of bullying which are classified as seldom, frequent or very frequent. These are shown by the two tables below representing the victims (table 1) and perpetrators (table 2). In all the modes of bullying either as a victim or perpetrator, the frequency decreased from seldom to frequent and very frequent having the least.

25

Table 1: Frequency of Direct Bullying: Victims

| Mode of Bullying | Response | Count | % | Frequency | Count | % |
|---------------------|----------|-------|------|-----------------|-------|------|

Table 3: Prevalence and Frequency of Indirect Bullying: Victims

Results on the frequency of perpetrators of indirect bullying were as follows: 30% said that they have refused to play with other students, 43.0% said that they would not be friends with other students and 18.8% said that they spoil other students games. The frequency of perpetrating varied from never to very frequently. In between there was seldom and frequent. This is shown by table 4.

Table 4: Frequency of Indirect Bullying: Perpetrators

| Mode | Response | Frequency | % | |
|---------------------------------|--------------------|-----------|-------|--|
| Refusing to | Never | 902 | 69.1. | |

| | Very Frequently | 36 | 2.8 | |

4.3 LOCATION OF BULLYING

Bullying took place in different places as identified by the students. These places were the play grounds, corridors, way to and from school and other places which the students did not identify. The play grounds formed the single most point where acts of bullying were carried out. Way to and from school was identified by day students. This is captured by table 5 below.

| Mode of Bullying | Where it Happened | Frequency | % |
|--------------------------------|--------------------|-----------|------|
| Being called a | Play Grounds | 671 | 71 |
| bad/ nasty name | Corridors | 111 | 11.7 |
| | Way to/from school | 163 | 17.0 |

| | Other Places | 236 | 32.9 |

Table 5: Location of Bullying

4.4 PERPETRATORS OF BULLYING

From the results, it was noted that most victims were bullied by members of their own school and class. These were then followed by students from higher class. This trend only changed when it came to threatening and beating other students which was done by students from the higher class. Only a small proportion of the victims were bullied by

students from other schools as shown by table 6.

| Mode of Bullying | Class Perpetrator Belonged To | No | % |
|-------------------------|-------------------------------------|-----|------|
| Called bad/nasty name | Own Class | 370 | 39.2 |
| | Parallel Class | 93 | 9.8 |

Table 6: The Class the Perpetrators Belonged To

4.5 BULLYING BY AGE

Results showed that there was no statistical difference in being a victim of direct bullying across the age groups. All ages had experienced bullying in their respective schools as shown by table 7.

Table 7: Victims of Direct Bullying by Age

| Mode of bullying | Age | , , | (es | | No | Tot | al | Test |

Table 10: Perpetrators of indirect bullying by age

4.6 BULLYING BY FORM

Results showed that victims of bullying per class varied depending on the mode of bullying. There was statistical significance in the following modes of bullying: having belongings taken for the form 2 (p=0.002), lies told about self for the form 3 (p=0.002), nasty tricks played on one for the form 3 (P=0.000), being threatened/blackmailed for the form2 (p 0.000) and being hit/beaten for the form 2 (p=0.004). The results are shown by table 11 below.

Table 13: Mode of Bullying By Form: Perpetrators of direct bullying

Perpetration of indirect bullying by form (table 14) produced statistical significant in all the modes as follows: refused to play with other students (p=0.026), refused to be friends with other students again (p=0.000), telling nasty stories about other that are not true (p=0.002) and spoiling other students game (p=0.013). All these are mainly on the form 2.

Table 14: Mode of Bullying By Form: Perpetrators of indirect bullying

4.7 BULLYING AND GENDER

Boys are leading in terms of having their belongings taken at 80.1% compared to the girls at 72.2%. Boys also are played nasty tricks on more than the girls at 70.0% for boys and 59.9% for girls. The results showed that girls tell more lies about each other compared to the boys though the difference is little as shown by figure 4. The p value for the different

modes are as follows: calling a nasty name (p=0.752), having belongings taken (p=0.003), lies told about self (p=0.266), nasty tricks played on one (p=0.001), threatened/blackmailed (p=0.017) while beaten or hit (p=0.733). The modes with statistical significance are: having belongings taken (p=0.003) for the males, nasty tricks played on one (p=0.001) for the males, being threatened/blackmailed (p=0.017) for the males. The other modes have no statistical significance.

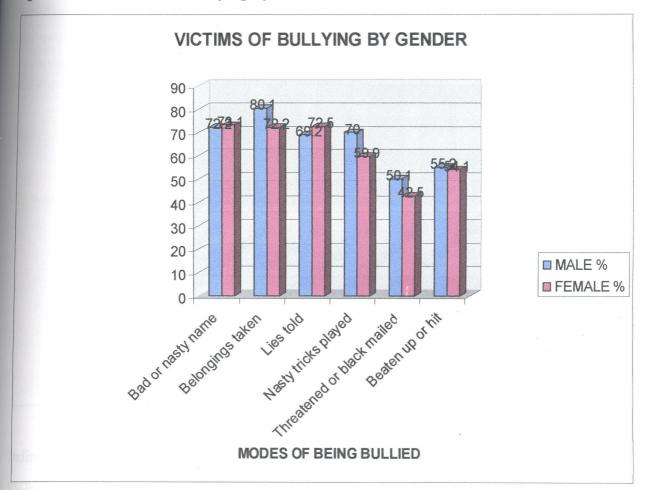

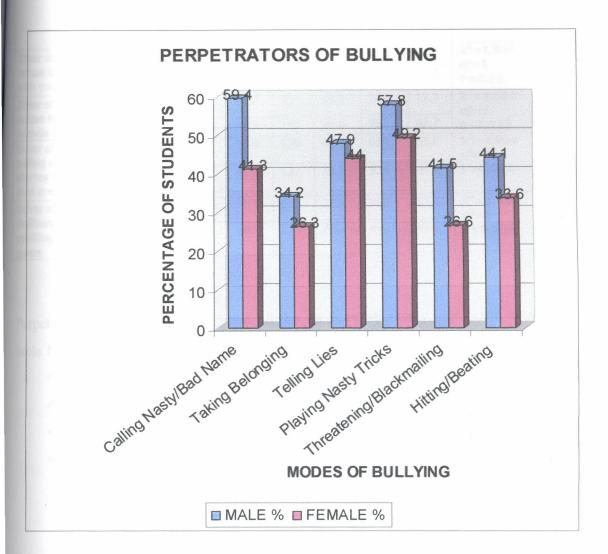

Figure 4: Victims of Direct Bullying By Gender

Results of perpetration of direct bullying show the following p values: calling others a nasty name (p=0.000) statistically important for the boys, taking belongings from others (p=0.009) again statistically important for the boys, telling lies about others (p=0.231) no statistical significance, threatening others (p=0.000) highly significant for the boys and

beating others (p=0.001) for the boys. This is shown by figure 5.

Indirect forms of bullying were also reported by both genders either as a victim or a perpetrator. Being a victim produced statistical significance in only two modes: other students telling nasty stories about an individual that are not true (p=0.048) for the boys and other students deliberately spoiling ones game (p=0.004). The other two modes were not statistically significant as shown by table 15.

TABLE 15: VICTIMS OF INDIRECT BULLYING BY GENDER

| Mode of Bullying | Respons e | Gend | er | | | | | Test |
|-------------------------------------|--------------|-------|------|------|------|-------|------|-------------------------------|
| and the second second | | Males | 5 | Fema | les | Total | | |
| | | No | % | No | % | No | % | |
| Other students | Yes | 117 | 12.0 | 30 | 9.2 | 147 | 11.3 | X ² =1.907 df=1 |
| refuse to play with you | No | 861 | 88.0 | 297 | 90.8 | 1158 | 88.7 | P=0.167 |
| Other students refuse to be your | Yes | 149 | 16.7 | 59 | 19.2 | 208 | 17.3 | X ² =1.023 df=1 |
| friends any more | No | 744 | 83.3 | 248 | 80.8 | 992 | 82.7 | P=0.312 |
| Other students telling nasty | Yes | 476 | 53.9 | 139 | 60.3 | 669 | 55.6 | X ² =3.904 df=1 |
| stories about you that are no true | No | 407 | 46.1 | 127 | 39.7 | 534 | 44.4 | P=0.048 |
| Other students deliberately | Yes | 256 | 30.1 | 61 | 21.3 | 318 | 27.9 | X ² =8.349 df=1 |
| spoiling your game | No | 597 | 69.9 | 226 | 78.7 | 823 | 72.1 | P=0.004 |

Perpetration of indirect bullying had all the modes statistically significant as shown in table 16;

- Refusing to play with others (p=0.000) for the boys
- Refusing to be friends with others (p=0.000) for the girls
- Telling nasty stories about others (p=0.001) for the boys
- Spoiling other students games (p=0.005) for the boys.

Table 16: Perpetrators of Indirect Bullying by Gender

4.8 TYPE OF SCHOOL AND BULLYING

Three categories of school were researched on. These are: a Boys School, a Girls School and two Mixed Schools. .Students in these schools under went various modes of bullying as shown in figure6.

As victims of direct bullying the p values are as follows:

- Being called a nasty name (p=0.594) not statistically significant
- Having belongings taken (p=0.000) statistically significant for the Boys school
- Having nasty lies told about self (p=0.248) which is not statistically significant
- Having nasty tricks played on one (p=0.000) statistically significant for the Boys school
- Threatened or blackmailed (p=0.000) significant for the Boys school
- being hit or beaten (p=0.093) which is not statistically significant

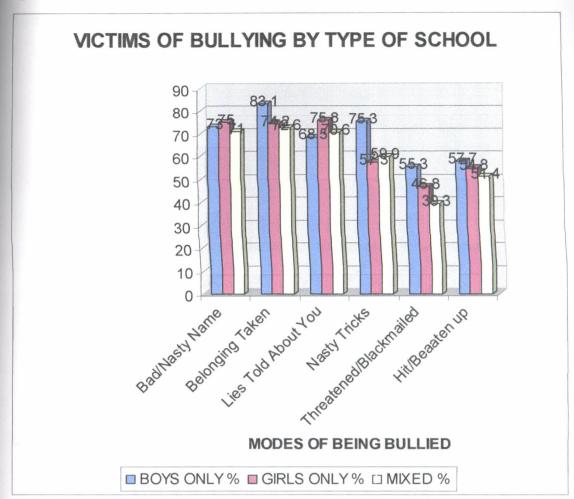

Figure 6: Victims of direct bullying by school Type

Results on perpetrators of bullying acts show that the Boys School Only led in all but on categories of bullying as shown in figure. The p values were as follows:

- calling others a bad or nasty name (0.000)
- taking belongings from others (p=0.000)
- telling lies about others (p=0.073) not statistically significant
- playing nasty tricks on others (p=0.001)
- threatening or blackmailing others (p=0.000)
- hitting or beating others (0.000)

All the modes were statistically significant for the boys' school apart from telling nasty tricks.

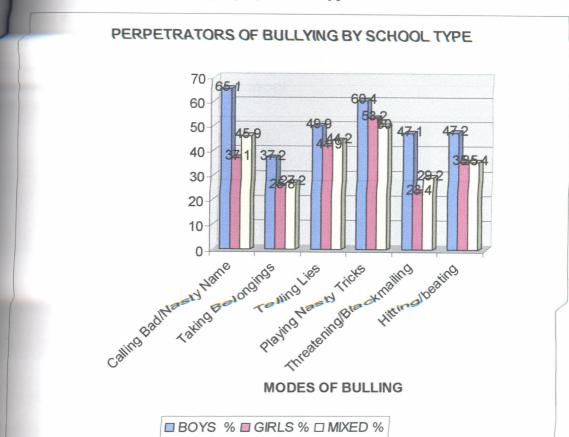

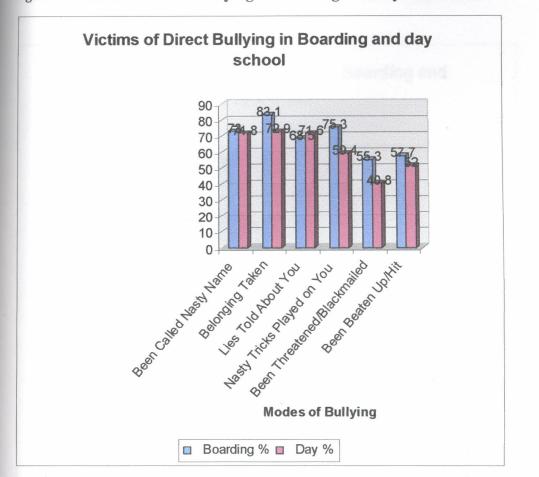

Figure 7: Perpetrators of Bullying By School Type

4.9 BOARDING AND DAY SCHOOLS AND BULLYING

The two categories of schools experience bullying as shown by figure 8 below. The p values for the victims of direct bulling:

- Being called a nasty name (p=0.620) not statistically significant
- Having belongings taken (p=0.000) statistically significant for Boarding school
- Having lies told about self (p=0.220) which is not statistically significant
- Having nasty tricks played on one (p=0.000) statistically significant for the Boarding school
- Threatened or blackmailed (p=0.000) significant for the Boarding school
- being hit or beaten (p=0.039) statistically significant for the Boarding school

Perpetration of bullying (figure 9) was highly statistically significant in boarding school as shown by the following p values.

- calling others a bad or nasty name (0.000)
- taking belongings from others (p=0.000)
- telling lies about others (p=0.025)
- playing nasty tricks on others (p=0.000)
- threatening or blackmailing others (p=0.000)
- hitting or beating others (0.000)

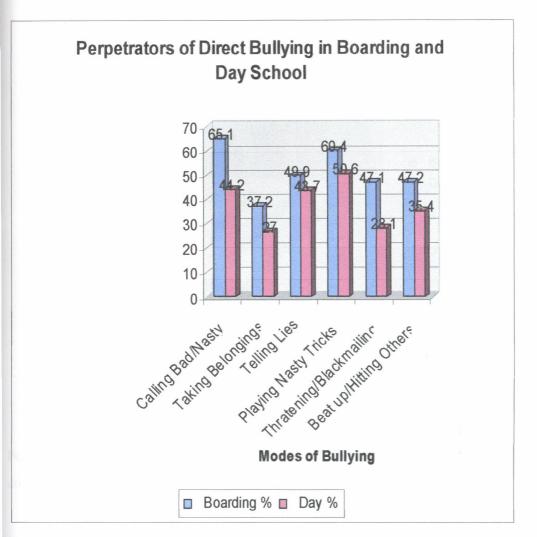

Figure 9: Perpetrators of Direct Bullying in Boarding and Day Schools

Victims of indirect bullying are shown by figure 10 and the p values are as follows

- other students refusing to play with you (p=0.003) for the boarding
- other students refusing to be your friends (p=0.979) not statistically significant
- other students telling nasty stories about you that are not true (p=0.015) for the Day school
- Other students spoil your game deliberately (p=0.000) for the boarding school

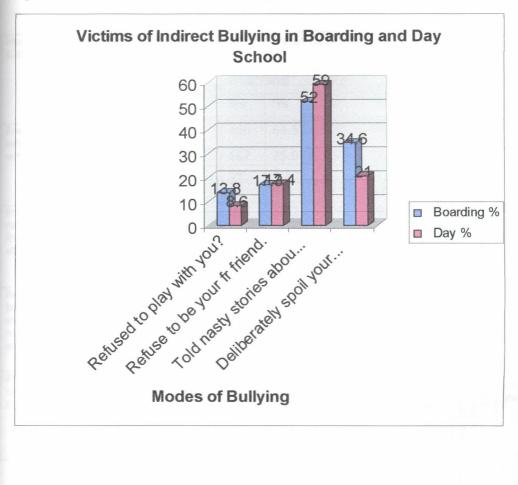

Figure 10: Victims of Indirect Bullying in Boarding and Day Schools

Perpetration of indirect bullying was highly statistically significant in boarding school compared to day schools. The p values are as shown by table 17.

- Refusing to play with others (p=0.000)
- Refusing to be friends with others (p=0.000)
- Telling nasty stories about others (p=0.001)
- Spoiling other students games (p=0.005).

4.10 BULLYING AND PSYCHOLOGICAL DISORDERS

Bullying led to psychological distress though the magnitude varied depending on the type/mode of bullying. The psychological effects were measured as: showing no distress, having evidence of distress and having severe psychological distress. Victims of direct bullying showed distress depending on the mode and this is shown by table 18. Modes with statistical significance were:

- Being called a nasty name (p=0.000)
- Having lies told about self (p=0.009)
- Having nasty tricks played on one (p=0.000)
- being hit or beaten (p=0.000)

Some students who perpetrated direct bullying suffered psychological distress as shown by table 19 below. The modes that had statistical significance are:

- calling others a bad or nasty name (0.000)
- telling lies about others (p=0.027)
- hitting or beating others (0.002)

Table 19: PERPETRATORS OF DIRECT BULLYING AND THEIR PSYCHOLOGICAL EFFECTS EF

Table 21: Psychological effects of Perpetrators of Indirect Bullying

4.11 PSYCHOLOGICAL DISTRESS ASSOCIATED WITH BULLYING AND AGE

Victims of direct bullying suffered distress depending on the age and mode. Statistical significance was noted in the following modes and ages and as shown by table 22a.

- 1. Being called a nasty name; 14-15 (p=0.001) and 16-17 (p=0.000)
- 2. Having belongings taken; 14-15 (p=0.003

- 3. Having lies told about self; 14-15 (p=0.000),16-16 (p=0.044) and 18-19 (p=0.003)
- Having nasty tricks played on one, 14-15 (p=0.011),16-17 (p=0.000) and 18-19 (p=0.017)
- 5. Threatened or blackmailed; 14-15 (p=0.049)
- 6. Being hit or beaten; 16-17 (p=0.003) and 18-19 (p=0.000)

Perpetrators of indirect bullying suffered psychological distress also as shown by table 23b. Modes and ages with statistical significance:

- 1. Refusing to play with others; 16-17 (p=0.000) and 18-19 (p=0.000)
- 2. Refusing to be friends with others; 18-19 (p=0.000)
- 3. Telling nasty stories about others; 16-17 (p=0.010)
- 4. Spoiling other student's games was not statistically significant for any age group.

4.12 PSYCHOLOGICAL DISTRESS ASSOCIATED WITH BULLYING AND GENDER

Different genders respond to direct bullying differently in terms of psychological distress as shown by table 24a. Modes with statistical significance for the perpetrators are:

1. calling others a bad or nasty name; male (p=0.001) and female(p=0.000)

- 2. taking belongings from others; females (p=0.033)
- 3. telling lies about others; males (p=0.041)
- 4. hitting or beating others; males and females (p=0.002)

Table 24a: Psychological Effects of perpetrators of Direct Bullying by Gender

Some victims of direct bullying suffered psychological distress as shown by table 25a below.

Modes with statistical significance for the victims of direct bullying by gender

- 1. Being called a nasty name; males (p=0.015) and females (p=0.000)
- 2. Having belongings taken; not significant
- 3. Having lies told about self; females (p=0.000)
- 4. Having nasty tricks played on one, males (p=0.001)
- 5. Threatened or blackmailed; not significant
- 6. Being hit or beaten; males (p=0.000)

Some victims of indirect bullying suffered psychological distress as shown by table 25b below.

Modes with statistical significance for the victims of indirect bullying by gender

- 1. other students refusing to play with you; not significant
- 2. other students refusing to be friends with you any more; females (p=0.003)
- 3. other students telling nasty stories about you that are not true; males (p=0.041)
- 4. Other students spoil your game deliberately; females (p=0.040)

Table 25b: Psychological Effects of Victims of Indirect Bullying by Gender

4.13 PSYCHOLOGICAL EFFECTS OF BULLYING BY FORM

Bullying produces different psychological effects on different forms in a school. This is also related to the different modes of bullying.

Victims of direct bullying by form have different psychological effects as shown by table

26a.

Modes with statistical significance for victims of bullying:

- 1. Being called a nasty name; form 1 (p=0.000) and form 2 (p=0.000)
- 2. Having belongings taken; not significant
- 3. Having lies told about self; form 1(p=0.000)
- 4. Having nasty tricks played on one, form 1(p=0.001)
- 5. Threatened or blackmailed; not significant
- 6. Being hit or beaten; form 2 (p=0.000), form 3 (p=0.003) and form 4(p=0.013)

Psychological effects of perpetrators of indirect bullying are shown by table 27b.

Modes with statistical significance are:

- 1. Refusing to play with others; form 1,2and3 (p=0.000)
- 2. Refusing to be friends with others; form 2 (p=0.003) and form 3 (p=0.036)
- 3. Telling nasty stories about others; form 2 (p=0.035)
- 4. Spoiling other student's games not significant

Results are based on nonempty rows and columns in each innermost subtable. * The Chi-square statistic is significant at the 0.05 level.

a More than 20% of cells in this subtable have expected cell counts less than 5. Chi-square results may be invalid.

b The minimum expected cell count in this subtable is less than one. Chi-square results may be invalid.

4.14 PSYCHOLOGICAL EFFECTS OF BULLYING AND SCHOOL TYPE

The three different types of schools have varying psychological effects of bullying.

Modes with statistical significant on the victims of direct bullying as shown by table 28a:

1. Being called a nasty name; Mixed (p=0.001)

- 2. Having belongings taken; not significant
- 3. Having lies told about self; Girls(p=0.002) and Mixed (p=0.000)
- Having nasty tricks played on one, Girls (p=0.009) Mixed (p=0.001) and Boys (p=0.024)
- 5. Threatened or blackmailed; not significant
- 6. Being hit or beaten; Boys (p=0.000), Girls (p=0.000) and Mixed (p=0.013)

After the analysis of the results it is clear that there is high prevalence of bullying in Kikuyu Division (p=0.000) and this leads to psychological distress (p=0.000). Therefore the null hypotheses was been rejected and the alternative hypotheses accepted.

5.0 DISCUSSIONS

5.1 PREVALENCE OF BULLYING

The results of this study show that bullying is prevalent in the schools studied in Kikuyu Division of Kiambu District. The prevalence varied depending on the mode of bullying. The study looked at both direct and indirect bullying.

The results concur with those found by Ndetei et al (8) in a study conducted in Nairobi Secondary Schools: the prevalence varied between 63.2% and 80% while in the current study the prevalence varied between 48.2% and 78.1%. Having belongings taken had the highest prevalence (78.1%), almost a similar rate of 80.1% by Ndetei et al (8) .Being threatened or blackmailed had the lowest prevalence (48.2%). In Ndetei et al (8) being threatened or blackmailed also had the lowest prevalence (63.2%), though higher than the current study. In Nigeria Egbochuku (6) found that different modes produced different prevalences and they were equally high. In other parts of the world studies carried out on prevalence of bullying indicate that bullying also takes place in these schools. In the UK Whitney and Smith (16) found that 27% reported being bullied regularly and 12% reported regular active bullying. Genta et al (56), in Italy, found that 46% of the students were bullied and 23% were actively bullying on a regular basis. In Jerusalem Schools Gofin et al (22) found that 57.1% of boys and 27% of girls were bullied by 50.3% of boys and 39.5% of girls. In other European studies on bullying the prevalence are lower than those found in this study (14, 15,17) where the prevalence ranged between 5% to 30%.

The study results show that different modes of bullying have different prevalence. Being beaten comprised 54.9% and having lies told about self has 70.0%. This concurs with Sampsons (11) who notes that beating is normally the least mode of bullying compared to spreading rumours about self. Telling lies about one is part of spreading rumours.

Possible explanations for the high prevalence in Kenya:

 The country does not have an effective anti bullying programmes like the ones established in many developed countries (57).

- Many acts of bullying are entrenched within the school systems such that they
 appear as an accepted norm. For example calling nasty names such as "mono'
 (meaning one) to the form one appears normal and nobody raises any protest over
 the issue.
- Those who were bullied want to revenge what they went through.

5.2 BULLYING AND PSYCHOLOGICAL DISORDERS

The research shows that bullying causes psychological distress (p=0.000). These findings concur with findings on Swedish and English school children on bullying where victims were found to be more anxious than those who had not experienced bullying (35,39). The findings also concur with Rigby's (32) findings in a study of Australian school children using the GHQ who noted that more victimized children than those not victimized showed high levels of anxiety, social dysfunction, depression as well as various somatic symptoms.. It also concurs with the findings of Kaltaila-Heino et al (44) who found increased prevalence of anxiety, depression and psychosomatic symptoms among bully- victims in a study of Finnish adolescent students.

Feelings of helplessness, rejection, fear and being demeaned when victimized occur and these lead to psychological distress. Many victims are quarreled by their parents who can not understand why their children are weaklings. Phrases such as 'aren't you man enough' are common to the male victims by their parents. This creates fear among the students and so don't report incidents of bullying but suffer in silence.

The findings that students were bullied by their own classmates, who, in most cases are their age mates, could be due to the fact that in a school day, the individual student is in contact with the class mates for most of the hours and therefore more interaction with them as opposed to members of other classes. The classmates know them better and are therefore capable of hurting them most. These findings were similar to those of Ndetei et al (9) and Fekkes (21).

Bullying acts were mainly carried out in schools. This is similar to other findings (3, 10, 11, 26,27). This could be due to the fact that the students are together most of the school hours in school.

Within the school, the play ground was the major single area where bullying was common. The students did not specify the 'other' places of bullying acts. Other studies have also pointed out that the play ground is a major point where bullying takes place. This is where adult supervision is minimum (6, 29). Students can perform the bullying acts as they pretend to be playing. There is need then for more active adult supervision in the play grounds.

This research, which was carried out in a rural setting elicited similar results as the study by Ndetei et al (8) which was done in an urban setting. It can therefore be concluded that bullying exists in both urban and rural schools in Kenya. It also compares to a study of bullying in the U.S.A where there was no difference between bullying in the urban, periurban and rural communities (27) and another done in Canada by Sampsons (11). The similarities found in this country can be explained by a number of factors: As had been noted earlier there lacks a policy in the country to guide on how to implement anti bullying activities in the schools. There is a constant movement of students from rural to urban and vice-versa and admission depending on the marks achieved by students.. As a result students in rural schools can and do have relatives in urban schools and as they exchange notes on how their schools are, they 'borrow' ideas of bullying as well. There is frequent transfer of students from one school to another and this transfers ideas of bullying from rural to urban setting. A t the same time, incidents of bullying are reported in the media and so students know what is going on in the schools throughout the country. This could explain the high prevalence of bullying in both rural and urban areas.

5.3 BULLYING AND GENDER

The study established that both boys and girls were involved in bullying both as victims and perpetrators. The prevalence was high for both but significant differences were found in different modes of bullying: having belongings taken had (p=0.003) for boys. In this particular mode it could be due to the fact that there was a Boys Boarding School where the prevalence of taking ones belongings was highest. This was discussed under Boarding and Day Schools. Nasty tricks played on one (p=0.001)-males and being threatened or

blackmailed (p=0.017)-males, other student deliberately spoiling ones games was higher among the males (p 0.004). This could be due to the physical aggressiveness of boys compared to the girls (21). Among the victims of indirect bullying only telling nasty stories about the individual was higher among the females as compared to males (p=0.048). It can be speculated that since girls value social relationships more than boys do, so girl bullies set out to disrupt social relationships with gossip, isolation, silent treatment and exclusion. (11).

In terms of being perpetrators, though both boys and girls were involved, there were significant differences between the two. The males had higher rates of perpetrating than the females in all modes apart from telling lies which was not statistically significant (p= 0.231). In perpetration of indirect bullying, the males were still leading the females apart from the mode of refusing to be friends with others where the girls were leading (p= 0.000). These findings are similar to those of Boulton and Underwood (15) ,Forero et al (24) and (6,10,25,26,27), where males were reported to be more involved in bullying than females. On the whole prevalence of perpetrating bullying acts were much lower compared to reported victimization. This corresponds to Ndetei et al and Fekes (21) findings.

Girls are reported to participate more in social exclusion as a way of bullying (27) while boys participate more in physical bullying. In the research girls refusing to be friends with others had (p=0.000) while the boys threatened more (p=0.017). This as mentioned earlier is because the girls value friendship and they know that it hurts to deny one friendship.

5.4 PSYCHOLOGICAL EFFECTS OF BULLYING AND GENDER

Different modes of bullying produced psychological distress. Girls are more distressed by being called a nasty name compared to boys (p=0.000), similarly having lies told about them distressed the females but not the males (p=0.000). Having nasty tricks played on the individual was distressful to the males than the females (p=0.001), being hit was more distressful to the males than the females (p=0.000). It is possible that the cultural aspect comes to play where men are not to be hit. This may injure the male ego especially

if hit in the presence of one's girlfriend or friends where one is likely to loose face. Victims of indirect bullying also had psychological distress. In this category only females had (p=0.003) when others refused to play with them. It could be postulated that females are more social and feel bad when rejected by others.

5.5 AGE AND BULLYING

The study showed no statistical difference in bullying among the age groups. All age groups had been bullied.

Psychological effects of bullying and age varied on the mode and the age category. Being called a nasty name had ((p=0.001) for 14-15 year olds and for the 16-17 year olds it was (p=0.000). This is more significant for the 16-17 age groups compared to the younger children. The younger children might find it okay to be called a nasty name but it is more demeaning to the older children. Also having belongings taken (p=0.003) was more distressful for the 14-15 year olds. This could be because the younger groups might not know how to explain the loss of their items or it is their first experience to loose items. If they are in a boarding school they don't have other items to use, and at the same time they have not made friends who can help them until their parents come. They could also be distressed about explaining to their parents about their losses or even how to get others. Being beaten was statistically significant for age categories 16-17 (0.00), 18-19 (p 0.000) and 20+ (p 0.000). The older group could feel humiliated by the beating and especially if beaten in the presence of the younger children.

5.6 BULLYING BY FORM

Bulling by form was significant depending on the mode. This was mainly affecting the form ones and twos which corresponds to a lower age. This corresponds to the definition of bullying where the weak are bullied most. The weak here are the younger ones. The psychological distress was experienced more by the lower classes, who needless to say are the younger ones in the school and therefore the weaker. This corresponds to findings by Whitney et al (16) which noted that bullying varies with year of school.

5.7 TYPE OF SCHOOL AND BULLYING

In the three types of schools there were different results depending on the mode of bullying. Bullying was more common in Boy's school only than in mixed and girls schools. This could be due to what had been discussed earlier about the aggressive nature of the boys. In the Mixed School the less bullying could be explained by the presence of the girls.

Psychological distress was experienced by students in the three groups of schools. This was determined by the different mode of bullying. Though the Boys school was more involved in bullying, the psychological distress was felt in all the schools depending on the mode. The Mixed school and the Girls Only school are day schools and this has an effect on the interpretation of the bullying acts, also the two schools have girls who interpret bullying differently from the boys.

5.8 BOARDING AND DAY SCHOOLS

Results of this study suggested that bullying was done in both Boarding and Day schools but it was more significant in the Boarding school. This corresponds to findings by Ndetei et al (8). It can be postulated that:

- there is more bullying in Boarding schools because the students are in contact with each other more than in day schools, they are together in the evenings and weekends when the day students are at their different homes
- in boarding schools there are more items available for picking compared to a day school
- loss of items in a day school can be replaced almost immediately but in boarding one has to do without in most cases thinks of ways of surviving.
- Some students genuinely lack items due to the poverty levels of their parent or guardians and so some tend to steal.
- When a student is in the dorm due to one reason or another for example being ill they could steal items

The psychological distress related to of bullying is more prevalent in Day than Boarding school. Rigby (58) found that those children who lack social support from home and

school suffer more from bullying. Lack of support from peers in the evening in day schools could lead to more psychological distress than in boarding schools where the student is with the other students and so gets peer support if they had experienced bullying. At the same time students in boarding schools will have recovered from the shock of bullying before they meet their parents or guardian.

The study suggests that those who were bullied are likely to bully. This can be concluded from the fact that there are more students who bully when they are in forms two and three as compared to form one. Thus those who were bullied and other new cases participate in bullying. This was also found by Ndetei et al (8).

5.9 LIMITATIONS

The study had limitations in that it only studied District Secondary schools within Kikuyu Division. The division has other types of schools. The findings of this study can therefore not be guaranteed.

5.10 DELIMITATION

The study used Olweus Bullying Questionnaire and The General Health Questionnaire to measure the prevalence of bullying and psychological distress. These are internationally used instruments and it is therefore possible to compare the results to other international researches conducted. This gives credibility to the research work.

5.11 CONCLUSION

Bullying exists in Kikuyu Division of Kiambu District. The prevalence is also high. Bullying also leads to psychological distress. Different modes of bullying have different prevalence and psychological effects.

5.12 RECCOMEDATIONS

- 1. School administration should take the necessary actions to stop bullying so that the students can learn in a peaceful environment.
- A similar study should be replicated in other provinces in Kenya so that should similar results be found a bullying policy for the whole country can be implemented.
- 3. The current research and the one of Ndetei et al (2007) indicate high prevalence of bullying. The school heads in the concerned areas should be ready to acknowledge it exists and implement the necessary measures against it.
- 4. There is need to develop a culture sensitive Bullying Questionnaire as the situation in Kenya is different from that of the developed countries. For example, many schools in Kenya have physical duties performed by students which constitute child labour in developed countries. These duties are a source of bullying in our situation. Kenya has more boarding schools than in developed countries.
- 5. It would be important to separate the various psychological disorders picked by the GHQ so as to know exactly what the students suffer from.
- **6.** Schools should develop better communication channels so that the students can report bullying.
- 7. The Kenyan Education System is a relic of the British colonial that tended to give too much power to the prefects, who misuse their position to bully other students. This makes it hard for other students to approach them and report about the bullying. The school authority have to be aware incase such a problem exists in their schools and sort it for the welfare of the other students.

APPENDICES:

Appendix 1:

School Principal Explanation and Consent Form:

My name is Anne W. Mbwayo, a Master of Science in Clinical Psychology student at the Department of Psychiatry, University of Nairobi. I have chosen to write my dissertation on "Bullying: Prevalence and its Association with Psychological Disorders among students in Public District Schools in Kikuyu Division". I have selected your institution as one of the participating schools. In the study it is only the students who will be asked to complete three questionnaires. The first questionnaire is on socio-demographic, which has been developed by me for this particular study. The next two questionnaires are internationally used instruments. One will measure the prevalence of bullying while the other will measure the general mental health experienced by the student after bullying. All the above questionnaires are self administered.

Apart from the highly confidential information from the student, there will be no physical procedures. However some information may be painful to the student but this study will provide a chance to the student to open up through the questionnaire. This overall result will help us to understand the prevalence of bullying in your institution and the psychological effects on the student and which could affect a healthy school learning environment. Students who have been highly traumatized can get an opportunity for help as my contact will be left so that any student who needs help can get in touch with me later.

Apart from the benefits to the students, the school and I, the researcher, there will be no other benefits or any financial incentives for taking part in this study. I will get all the necessary official approvals for this study to be done which I will make available to you before the study begins.

99

As the Head of the school, I regard you as the guardian of the students, I am therefore requesting for your permission to carry out the study which you can withdraw at any time during the course of data collection. I will also explain to the students the nature of the study and request them to complete the questionnaires. Attached please find the questionnaires that will be given to the students.

Yours Faithfully, Anne W. Mbwayo. Msc. Clinical Psychology Student, Department of Psychiatry, University of Nairobi. Tel 0733823896. **Appendix 2:**

Consent by Principal:

I.....being Head of..... Secondary School and having been explained the nature of the study by Anne W. Mbwayo P.O. Box 63254-00619 Nairobi , Tel 0733823896, as detailed in a write-up, do here by give consent for the students in my school to participate in the study. I understand I can withdraw this consent any time before the data collection is over.

ASSENT EXPLANATION FOR PARTICIPANTS IN THE STUDY OF; BULLYING: PREVALENCE AND ITS ASSOCIATION WITH PSYCHOLOGICAL DISORDERS AMONG STUDENTS IN PUBLIC DISTRICT SCHOOLS IN KIKUYU DIVISION:

- My name is Anne W. Mbwayo from the department of psychiatry, University of Nairobi. I am carrying out research to find out the prevalence and psychological effects/consequences of bullying and I will also use the information for my Masters Degree dissertation in Clinical Psychology in the same University.
- Although I got permission from the school principal to carry out the research, I would like to explain to you what I intend to do so that you can decide yourself whether you wish to participate or not.
- I would like to request you to participate in the research to find out how widespread bullying is in your school and how bullying affects your psychological well being. If you agree to participate I will require you to read and respond appropriately to a list of questions below that ask about your personal details, bullying and how it affects you. This exercise should not take more than 30 minutes in total.

For purposes of clarity, we say that a student is being bullied when another student or several other students:

- say mean and hurtful things or make fun of him or her or call him or her mean and hurtful names,
- completely ignore or exclude him or her from their group of friends or leave him or her out of things on purpose,
- hit, kick, push, shove around, or threaten him or her,

102

- tell lies or spread false rumors about him or her or send mean notes and try to make other students dislike him or her,
- and do other hurtful things like that.

These things may take place frequently, and it is difficult for the student being bullied to defend himself or herself. It is also bullying when a student is teased repeatedly in a mean and

hurtful way.

Its not bullying when people of equal strength or power quarrel.

Risk/Discomfort:

The only risk from this study may be the uncomfortable feelings when we ask you questions on how you were bullied and how you felt. No test will be done on you such as blood tests or any other specimen.

Benefits:

If you still suffer from any psychological distress, you can contact me and I will arrange for help. You can still send me a message on this number 0733823896 or write a letter to me on this address,

Anne W. Mbwayo, P.O. Box 63254-00619,

Nairobi.

If you still wish you can ask the teacher or somebody else you trust to contact me.

The results of this study will be used to find out ways of preventing bullying in your school if it exists.

Confidentiality:

All the information that you write will be treated with confidentiality. To ensure this you do not write your name on any questionnaire. You will not be paid to take part in the study, it is your choice. If you choose to join the study then answer the following questions to the best of your ability. Once you've completed fold the questionnaire and drop it in the provided box. If you do not want to complete the questionnaire still fold it and drop it in the provided box. I will respect your decision not to complete the questionnaire and will not be penalized in any way.

Your completion of the questionnaire will be taken as your assent to participate in the study.

Yours Sincerely, Anne W. Mbwayo Masters of Science in Clinical Psychology student Department of psychiatry, University of Nairobi. Tel: 0733823896.

APPENDIX 4

THE SOCIO-DEMOGRAPHIC QUESTIONNAIRE

| 1) Which form are you in? |
|--|
| 2) Choose the category of your school. |
| Boarding Day Day |
| 3) Is your school? |
| a) Boys only |
| b) Girls only |
| c) Mixed |
| 4) Date of Birth Day Month Year |
| 5) Gender Male |
| Female |
| 6) How many siblings do you have? |
| 7) What is your birth position? |
| 8) Are you living with both parents? |
| 9) If no, whom are you living with? |
| a) Mother |
| b) Father |
| c) Others (specify) |

APPENDIX 5:

| BULLYING QUESTIONNAIRE: |
|--|
| SECTION A: THESE QUESTIONS REFER TO YOUR EXPERIENCE IN |
| YOUR PRESENT SCHOOL. |
| (PLEASE TICK/WRITE THE MOST APPROPRIATE ANSWER THAT |
| APPLIES TO YOU). |
| 1.1) Have you been called bad or nasty names? |
| a) Yes b) No |
| 1.2) If yes, How often in the past 6 months? |
| a) Seldom (1-3 times) b) Frequently (4 times or more) |
| 1.3) If yes to (1.1) above where did it happen? |
| a) Play grounds b) Corridors c) Way to/ from school |
| d) Other areas (specify) |
| 1.4) From which class did the perpetrator(s) above belong? |
| a) Own class b) Parallel class c) Higher class |
| d) Lower classe) Other school |
| 1.5) Were they |
| a) Boys b) Girls c) Both boys and girls |
| 1.6) Have you called any other student(S) bad or nasty names in the past 6 months? |
| a) Yes b) No |
| 1.7) If yes, how often in the past 6 months? |
| a) Seldom b) Frequently c) Very frequently |
| |
| 2.1) Have you had your belongings taken? |
| a) Yes b) No |
| 2.2) If yes, how often in the past 6 months? |
| a) Seldom b) Frequently c) Very Frequently |

2.3) If yes to (2.1) above where did it happen?

| a) Play ground b) Corridors c) Way to/from school |
|---|
| d) Other areas (specify) |
| 2.4) From which class did the perpetrator(s) of the above belong? |
| a) Own class b) Parallel class c) Higher class |
| d) Lower class e) Other school |
| 2.5) Were they |
| a) Boys b) Girls c) Both boys and Girls |
| 2.6) Have you taken belongings from any other student(s) in the past 6 months? |
| a) Yes b) No |
| 2.7) If yes, how often? |
| a) Seldom b) Frequently c) Very frequently |
| 3.1) Have you had lies told about you? |
| a) Yes b) No |
| 3.2) If yes, how often in the past 6 months? |
| a) Seldom b) frequently c) Very frequently |
| 3.3) If yes, to (3.2) above where did it happen |
| a) Play grounds b) Corridors c) Way to/from school |
| d) Other areas (specify) |
| 3.4) From which class did the perpetrator(s) of the above belong? |
| |
| a) Own class b) Parallel class c) Higher class |
| d) Lower class e) Other schools |
| 3.5) Were they |
| a) Boys b) Girls c) Both boys and girls |
| 3.6) Have you told lies about other students in the past 6 months? |
| a) Yes b) No |
| 3.7) If yes, how often? |
| (a) Seldom (b) Frequently (c) Very frequently |

| 4.1) Have you had nasty tricks played on you? | |
|---|---|
| a) Yes b) No | |
| 4.2) If yes, how often? | |
| a) Seldom b) Frequently c) Very frequently | |
| 4.3) If yes to (4.1) above where did it happen? | |
| a) Play ground b) Corridors c) Way to/ from school |] |
| d) Other areas (specify) | |
| 4.4) From which class did the perpetrator(s) of the above belong? | |
| a) Own class b) Parallel class c) Higher class | |
| d) Lower class e) Other schools | |
| | |
| 4.5) Were they | |
| a) Girls b) Boys c) Both girls and boys | |
| 4.6) Have you played nasty tricks on other students? | |
| a) Yes b) No | |
| 4.7) If yes, how often in the in the past 6 months | |
| a) Seldom b) Frequently c) Very frequently | |
| 5.1) Have you been threatened or blackmailed? | |
| a) yes b) No | |
| 5.2) If yes, how often? | |
| a) Seldom b) Frequently c) Very frequently | |
| 5.3) If yes to (5.1) above where did it happen? | |
| a) Play grounds b) Corridors c) way to/from school | |
| d) Other areas (specify) | |
| 5.4) From which class did the perpetrator(s) of the above belong? | |
| a) Own class b) Parallel class c) Higher class | |
| d) Lower class (a) Other schools (b) | |
| 5.5) Were they | |

| a) Boys b) Girls c) Both girls and boys |
|---|
| 5.6) Have you threatened or blackmailed any student in the past 6 months? |
| a) Yes b) No |
| 5.7) If yes, how often |
| a) Seldom b) Frequently c) Very frequently |
| 6.1) Have you been beaten up or hit? |
| a) Yes b) No |
| 6.2) If yes, how often in the past 6 months? |
| a) Seldom b) Frequently c) Very Frequently |
| 6.3) If yes to (6.2) above, where did it happen? |
| a) Play ground b) Corridors c) Way to/from school |
| d) Other areas (specify) |
| 6.4) From which class did it the perpetrator(s) belong? |
| a) Own class b) Parallel class c) Higher class |
| d) lower class e) other schools |
| 6.5) Were they |
| a) Boys b) Girls c) Both boys and girls |
| 6.6) Have you hit or beaten up another students in the past 6 months? |
| a) Yes b) No |
| 6.7) If yes, how often? |
| a) Seldom b) Frequently c) Very frequently |

SECTION B: - THESE QUESTIONS REFER TO YOUR EXPERIENCE IN YOUR PRESENT SCHOOL

| 1.1) Have other students refused to play with you? |
|---|
| a) Yes b) No |
| |
| 1.2) If yes, give an example and descriptive of how it |
| happened |
| |
| |
| 1.3) How frequently does it happen? |
| a) Seldom b) Frequently c) Very frequently |
| 1.4) How frequently have you refused to play with other students? |
| a) Never b) Seldom c) Frequently |
| d) Very frequently |
| 2.1) Have other students said they will not be your friend anymore |
| a) Yes b) No |
| 2.2) If yes, give examples and description of how it |
| happened |
| |
| |
| 2.3) How frequently does it happen? |
| a) Never b) Seldom c) Frequently |
| d) Very frequently |
| 2.4) How frequently have you said you would not be friends with other students? |
| a) Never b) Seldom c) Frequently |
| d) Very frequently |
| |

3.1) Have other students told nasty stories that were not true about you?

| a) Yes b) No |
|---|
| 3.2) If yes, give examples and descriptive of how it happened |
| |
| |
| |
| 3.3) How frequently does it happen? |
| a) Never b) Seldom c) Frequently |
| d) Very frequently |
| 3.4) How frequently do you tell nasty stories about other students that are not true? |
| a) Never b) Seldom c) Frequently |
| d) Very frequently |
| 4.1) Do other students deliberately spoil your game? |
| a) Yes b) No |
| 4.2) If yes, give examples and how it happened |
| |
| |
| |
| 4.3) How frequently does it happen? |
| a) Never b) Seldom c) Frequently |
| d) Very frequently |
| |
| |
| 4.4) How frequently do you spoil other students games |
| a) Never b) Seldom c) Frequently |
| d) Very frequently |
| |

APPENDIX 6

General Health Questionnaire (GHQ)

We want to know how your health has been in general over the last few weeks. Please read the questions below and each of the four possible answers. **CIRCLE** the response that best applies to you.

Thank you for answering all the questions.

Have you recently:

| 1) Been able to concentrate on what you're doing? | | | |
|---|-------------------------|--------------------|----------------------|
| Better than usual | same as usual | less than usual | much less than usual |
| (0) | (1) | (2) | (3) |
| | | | |
| 2) Lost much slee | ep over worry? | | |
| Not at all no more | re than usual rather | more than usual | much more than usual |
| (0) | (1) | (2) | (3) |
| | | | |
| 3) Felt that you a | re playing a useful par | t in things? | |
| More so than usua | al same as usual | less so than usual | much less than usual |
| (0) | (1) | (2) | (3) |
| | | | |
| 4) Felt capable of making decisions about things? | | | |
| More so than usua | al same as usual | less than usual | much less than usual |
| (0) | (1) | (2) | (3) |
| | | | a. |
| 5) Felt constantly under strain? | | | |
| Not at all no mo | ore than usual rathe | r more than usual | much more than usual |
| (0) | (1) | (2) | (3) |

| Not at all no more than usual rather more than usual (0)much more than usual (1)much more than usual (2)much more than usual (3)7) Been able to enjoy your normal day to day activities? More so than usual same as usual less so than usual (0)much less than Usual (3)8) Been able to face up to your problems? More so than usual same as usual less than usual (0)much less than Usual (3)8) Been able to face up to your problems? More so than usual same as usual less than usual (0)much less than Usual (3)9) Been feeling unhappy or depressed? Not at all no more than usual rather more than usual much more than Usual (0)(1)(2)(3)(3)10) Been losing confidence in yourself? Not at all no more than usual rather more than usual much more than Usual (0)(1)(2)(3)11) Been thinking of yourself as a worthless person? Not at all no more than usual rather more than usual much more than Usual (0)(1)(2)(3)12) Been feeling reasonably happy, all things considered? More so than usual same as usual less so than usual (2)much less than Usual (3) | 6) Felt you couldn't overcome your difficulties? | | | |

RE: RESEARCH AUTHORIZATION

Following your application for authority to carry out research on, 'Bullying: Prevalence and its Association with Psychological Disorders among Students in Public District Secondary Schools in Kikuyu Division of Kiamlyu District,

I am pleased to inform you that you have been authorized to carry out research in Kiambu District for a period ending 30th October 2007.

You are advised to report to the District Commissioner and the District Education Officer Kiambu District before embarking on your research project.

On completion of your research, you are expected to submit two copies of your research report to this office.

M. GATOBU FOR: PERMANENT SECRETARY

Copy to:

The District Commissioner **Kiambu District**

The District Education Officer Kiambu District
