

Maintenance of the College Supply Tank

To address the challenge of intermittent water supply the college has been facing for a while, the maintenance team working together with Davis and Shirliff Company has embarked on finding a lasting solution to this challenge. The team has been assessing the college water tank and the borehole to find the actual cause of the problem. On September 30, 2015, the team did a comprehensive analysis of the college borehole noting about the water level and its depth and its implication on the intermittent water supply in the college. The team will further carry out more analysis and provide the college with a lasting solution to this problem.
